

Deep Vein Thrombosis

Deep vein thrombosis (DVT) is a blood clot that has formed in a vein. The veins of your leg, especially the calf and thigh, are the most common areas to find the clot. Deep vein thrombosis can lead to damage of the blood vessels in your leg.

Deep vein thrombosis can also cause a serious lung problem. If the clot in the vein breaks away from the wall of the vessel and travels to the lungs, it can block blood circulation to the lungs. This problem is called a pulmonary embolism.
